CyberSafe — Cybersecurity Awareness Chatbox

Overview

CyberSafe is a beginner-friendly desktop chatbot built with Python and Tkinter. It gives general awareness information about phishing, passwords, malware, ransomware, Wi-Fi safety, suspicious URLs, multi-factor authentication, backups, updates, and compromised accounts.

Requirements

- Python 3.9 or newer recommended
- Tkinter (usually included with Python)
- No third-party pip packages are required

Run the project

1. Download or copy chatbox.py.
2. Open a terminal or command prompt in the project folder.
3. Run: python chatbox.py
4. Type a question or help in the chat window.

Example questions

- What is phishing?
- How can I make a strong password?
- Explain malware
- Is public Wi-Fi safe?
- What should I do if my account is hacked?
- help

Project features

- Graphical chat window using Tkinter
- Message input and Send button
- Keyword-based answers from a built-in knowledge base
- Time labels for messages
- Handles unknown questions with a help prompt

Limitations

This is an educational, rule-based chatbot. It does not use machine learning, scan files, verify URLs live, or replace professional incident response. Its answers are general guidance and may not cover every situation.

Safety

Only test security tools and techniques on systems you own or have explicit permission to assess. Do not enter real passwords, OTPs, or other confidential information into demonstration projects.
